# WHAT IS YOUR DIAGNOSIS

Pranee Tuntivanich

Lateral position of the vertebral column of a dog.

# History

A one-year-old female, mixed breed dog, was hit by a car a day before. The dog can not use the hind limbs. On palpation, the animal shows the symptom of pain when pressing on the lumbar area. Sensory and motor reflexes can not be detected.

 $\hbox{Lateral projection of the thoraco-lumbar area was taken.}$  Give your diagnosis and turn to page \$121\$

#### Radiographic Diagnosis

Fracture of the distal epiphysis of the body of third lumbar vertebra.

#### Radiographic Findings and Comments

Ventral displacement of the distal epiphysis of the third lumbar vertabra is evident on lateral projection. This evidence is of traumatic origin.

Epiphyseal fracture causes are increased space at the epiphyseal line (arrow) and a narrowing of the intervertabral space between the third and fourth lumbar vertebrae. Any narrowing of the intervertebral space is suggestive of protrusion to the intervertebral disc which can cause paresis or paralysis of the hind quarter.
